EXPERIENCE

Software Engineer II, Anduril Industries

Oct 2024 – Jun 2026

- Consolidated fragmented, mostly manual testing into a self-serve simulation platform — making results comparable across methodologies and fidelity levels for the first time, and establishing the historical baselines teams rely on to catch regressions; adopted across teams and folded into the core platform.
- Designed and built the platform core — orchestration state machine, full CLI, Go bootstrappers, containerization — scaling to **hundreds of thousands of tests per run** on Flyte with automated per-run and aggregate analysis.
- Extended an internal cloud platform (Kubernetes on AWS) that let **~500 engineers** (~70% of engineering) self-provision ephemeral test environments (secondary networks, DNS endpoints, SSH access, test scripts), sustaining up to **1,200 concurrent environments across ~1,000 nodes** running VMs, pods, and hardware-in-the-loop workloads; added CLI features and configurable infrastructure types for environment pods.
- Enabled self-serve observability — built reusable Terraform modules that let teams provision per-cluster Datadog alerts — and stood up platform services with Helm, Kubernetes manifests, and Terraform; kept the platform reliable through on-call rotation and rapid triage.
- Owned platform cost end-to-end: built the billing, chargeback, and cost-prediction tooling Finance uses to bill **~\$1.6M/month** in compute to consuming teams, and surfaced a topology-spread vs. bin-packing scheduling inefficiency, enabling **~\$1.2M/year** in realized compute savings.

Backend Software Engineer, Microsoft (Azure)

Nov 2022 – Oct 2024

- Scaled Azure App Service Domains from a **single region to 36+ regions**, leading the database, background-job, and data-layer redesign and a four-phase regionalization plan (fallback, concurrency, data replication, traffic management) that eliminated the single-region point of failure for **80,000+ customers**.
- Cut domain fraud **by over 90%** by building new alerting and pre-purchase validation.
- Architected automated infrastructure across **40+ regions** for Azure App Service Managed Certificates, cutting certificate sync **from hours to minutes**.

Software Engineer, Microsoft (Azure)

Feb 2022 – Nov 2022

- Drove the Azure Container Apps CLI from private beta to public release, and engineered the first Azure CLI end-to-end fully managed deployment command — demoed at Microsoft Build 2022.
- Developed and maintained Azure App Service CLI commands serving **2M monthly active users**.

EDUCATION

University of North Carolina at Chapel Hill

2018 – 2021

B.S. Computer Science; B.S. Statistics & Analytics — *Graduated with Highest Distinction*

SKILLS

Languages: Go · Python · C# · JavaScript

Infrastructure & Platform: Kubernetes · Terraform · Helm · ArgoCD · Docker · Flyte · Datadog

Cloud & Backend: AWS · Azure · gRPC · Protobuf · .NET · SQL
